

Stock Locator

Simple Training Guide

Use this guide to search inventory, manage products, manage locations, and print or export reports. The app is designed mainly for mobile use, so the steps are written for phone workflows.

Best practice: Search first, then edit only when needed. This keeps the Manage screen from feeling crowded and helps prevent accidental changes.

1. Signing In

- Open the Stock Locator app website.
- Enter your email and password, then tap Sign In.
- If you do not have an account, tap Create Account and follow the prompts.
- If you forget your password, tap Forgot password? and check your email for the reset link.

2. Search For A Product

- Open the Search tab.
- Start typing the product name, department, color, size, area, section, or location number.
- The app will show matching products only after you search, keeping the screen cleaner on mobile.
- Tap See All if you need to view every product. Tap Hide All to return to the cleaner search view.

Search cards show the product name, department, color, size, and location. Product names are color-coded by department.

Department Colors

Department	Color
Woman	Dark pink
Men's	Blue
Kids	Orange
Toddler	Purple
Accessories / Apparel	Green

3. Add A Product

- Open Manage, then choose Products.
- Tap Add Product.
- Enter the product name, department, optional color, optional size, and choose one or more locations.
- Tap Save Product.

A product can be assigned to multiple locations. This is useful when the same product is stored in more than one area.

4. Edit Or Delete A Product

- Open Manage, then choose Products.
- Use Find product to manage, or tap See All.
- Tap Edit to update product details or locations.
- Tap Delete only if the product should be fully removed from inventory.

5. Add A Location

- Open Manage, then choose Locations.
- Tap Add Location.
- Enter Area, Section, and Number.
- Tap Save Location.

Each location is built from Area, Section, and Number. Example: Back Room / Wall 1 / A12.

6. Find Locations In Manage

- Open Manage, then choose Locations.
- Use the Area picker to show one area.
- Use the Section picker to narrow the list further.
- Use Sort to order by area, section, number, most products, or fewest products.
- Tap Clear to reset the filters.

7. View A Location

- Open Manage, then choose Locations.
- Tap a location card or tap Open.
- The location screen shows only products assigned to that location.
- Tap Add Product Here to create a new product directly inside that location.
- Tap Remove to remove a product from that location only.
- Tap Delete to remove the product from inventory completely.

Important: Remove and Delete are different. Remove only takes the product out of the current location. Delete removes the product from the whole app.

8. Edit A Location Safely

- Open the location from Manage > Locations.
- Tap Edit Location.
- Update Area, Section, or Number.
- Tap Save Location when finished.
- Tap Cancel if you do not want to save changes.

9. Export And Print

- Open the Export tab on a desktop or larger screen.

- Use Products with Locations to print or export product data.
- Use the Department picker if you only want one department.
- Use Locations with Products to print or export location data.
- Choose one location to print that location only, or choose All locations.

The Export tab is hidden on mobile to keep the phone interface simple.

10. Quick Troubleshooting

- If changes do not appear right away, refresh the page.
- If the live website was just updated, wait one or two minutes for GitHub Pages to refresh.
- If a product is missing from a location, edit the product and check that the correct location is selected.
- If you cannot sign in, use Forgot password? or confirm that the account email is correct.
